Summary

Backend engineer with production experience in **Python** and **Go** across logistics, fintech and healthcare — microservices, payment and banking integrations (10+ banks), real-time systems and LLM/agent workflows. Currently building multi-tenant SaaS for the US auto-transport industry and leading a 4-person backend team on a healthcare platform.

Experience

Backend Developer, TheCargo · thecargo.io

Jul 2026 – Present

Multi-tenant SaaS for the US auto-transport industry — shipment dispatch, carrier load boards, payments and customer messaging.

- Build and maintain services across a 12-service Python backend (FastAPI, async SQLAlchemy 2.0, PostgreSQL, Celery, RabbitMQ, Redis) spanning shipments, billing, communication, auth, analytics, audit and load-board integration.
- Delivered the platform admin console end to end — a cross-service admin API over seven microservices behind a shared cross-tenant repository and token guard, plus its 65-screen React 19 / TanStack front end.
- Built the premium iMessage subsystem: per-line contact allowances and slot metering, automatic fallback to standard SMS when an allowance is exhausted, vendor-accurate cost accounting, and delivery analytics for the operations panel.
- Unified sequences, broadcasts and automations behind a single campaign surface, with stage-aware suppression so automations stop when a shipment leaves their stage, and per-line gating for outbound AI calls.
- Shipped payments and commission features on Stripe — refund-to-payment and processor attribution, agent commission proposals, payroll runs with approve/unwind transitions, and a cached payment-overview endpoint.
- Hardened cross-tenant auth and audit: session revocation on password reset, email change and deactivation, platform-wide email uniqueness, and team-scoped audit and dashboard visibility.

Team Lead & Backend Developer, Onlayn Hamshira (remote) · app.onlaynhamshira.uz

Jun 2025 – Present

On-demand home-healthcare platform — 11,000+ users, 300+ active nurses, 13,000+ completed orders.

- Lead a 4-person backend team; own architecture decisions, releases and code review across the platform backend.
- Re-architected a legacy PHP (Yii2) monolith into 5 async Python microservices (FastAPI, SQLAlchemy 2.0, PostgreSQL 16 + PostGIS, RabbitMQ, Redis, Celery) with database-per-service design.
- Designed a distributed order-offering system matching each request to nearby nurses in real time — PostGIS candidate selection, simultaneous offer broadcast and race-safe first-accept assignment — plus live GPS tracking over WebSockets, scaled with Redis pub/sub and hardened with ack-based delivery and replay on reconnect.
- Designed the payment service — Payme, Click (incl. mini-app), Paynet, Hambi and Hamkorbank — with a transactional outbox, webhook signature verification and a double-entry wallet ledger for nurse earnings and withdrawals.
- Migrated live production data off the legacy system with zero downtime, and own platform DevOps — Kubernetes deployments, GitLab CI/CD with automated per-service migrations, and Prometheus + Sentry observability.

Backend Developer, AIBA — AI Business Assistant · aiba.uz

Dec 2025 – Jun 2026

Fintech startup — AI-powered accounting platform serving 200+ business clients and 10+ accounting outsourcing firms.

- Worked across all backend microservices — banking, tax, e-invoicing, payments, 1C accounting and the AI hub (FastAPI, PostgreSQL, Celery, RabbitMQ) — and contributed to core architecture decisions.
- Integrated internet-banking automation for 10+ Uzbek banks — payments and drafts, payroll registers, salary and treasury operations, OTP authentication — on async task pipelines with retries, hard timeouts and credential-lock safeguards.
- Built tax-authority integrations end-to-end: a tax-mail subsystem with incremental sync, caching, atomic writes and Telegram alerts, plus fiscal-check and reconciliation reporting services.
- Delivered e-invoicing (EDI) document sync and digital-signature (E-IMZO) workflows, a token-signing service replacing vendor middleware for USB security keys with concurrent multi-token support, and desktop bank-portal connectors.
- Implemented platform-wide soft delete via RabbitMQ consumers, passkey (WebAuthn) login, LangGraph tools for a 66-tool AI assistant, and an OCR captcha-solving microservice enabling automated bank-portal sync.

Backend Developer, w2w (software agency) · w2w.uz

Jun 2025 – Jun 2026

- Sole developer of an Amadeus GDS flight search and booking platform — multi-tenant Go microservices (fetcher, session-manager) with Node.js, MongoDB and Puppeteer: automated GDS sessions with keepalive and exponential backoff, real-time Socket.IO updates, and per-client Docker/Traefik deployments.

Skills

Languages: Python, Go, SQL

Backend: FastAPI, Django / DRF, Gin, SQLAlchemy, WebSockets, gRPC, Celery, RabbitMQ, async I/O

Data: PostgreSQL (PostGIS, pgvector), Redis, MongoDB, MinIO/S3, Alembic

AI / LLM: LangGraph, LangChain, OpenAI, Gemini, RAG & embeddings, agent tool design

Frontend: React 19, TypeScript, TanStack (Router / Query / Table), Tailwind, Vite

Integrations: Stripe, Telnix, SendGrid, bank internet-banking APIs, Payme / Click / Paynet, Soliq tax API, E-IMZO signing, Telegram bots

DevOps: Docker, Kubernetes, GitLab CI/CD, GCP, Terraform, Prometheus, Grafana, Sentry

Education

Inha University in Tashkent — B.Sc. Computer & Information Engineering

Sep 2023 – 2025

Completed 2 years (currently on academic break). Focus: Algorithms & Data Structures, Systems, AI & ML.

Languages: Uzbek — native · English — professional working proficiency.
